

Resolución

1.

$$\begin{aligned}
 F(y) &= \int_0^y (\theta + 1)t^\theta dt = \\
 (\theta + 1) \int_0^y t^\theta dt &= \\
 (\theta + 1) \left[\frac{t^{\theta+1}}{\theta + 1} \right]_0^y &= \\
 (\theta + 1) \frac{y^{\theta+1}}{\theta + 1} &= \\
 y^{\theta+1}
 \end{aligned}$$

2.

$$\begin{aligned}
 E(Y) &= \int_0^1 (\theta + 1)y^{\theta+1} dy = \\
 (\theta + 1) \int_0^1 y^{\theta+1} dy &= \\
 (\theta + 1) \left[\frac{y^{\theta+2}}{\theta + 2} \right]_0^1 &= \\
 (\theta + 1) \cdot \left(\frac{1^{\theta+2}}{\theta + 2} \right) &= \\
 \frac{\theta + 1}{\theta + 2}
 \end{aligned}$$

3.

Igualamos el momento poblacional al muestral:

$$\begin{aligned}
 \frac{\theta + 1}{\theta + 2} &= \bar{Y} \\
 \theta + 1 &= \bar{Y}(\theta + 2) \\
 \theta + 1 &= \bar{Y}\theta + 2\bar{Y} \\
 \theta + 1 - \bar{Y}\theta &= 2\bar{Y} \\
 \theta - \bar{Y}\theta &= 2\bar{Y} - 1
 \end{aligned}$$

$$\theta = \frac{2\bar{Y} - 1}{1 - \bar{Y}}$$

Dada la muestra y:

$$\hat{\alpha}_1 = \bar{Y} = \frac{0,9 + 0,8 + 0,7 + 0,6 + 0,5}{5} = 0,7$$

$$\hat{\theta} = \frac{2 \cdot 0,7 - 1}{1 - 0,7} = 1,33$$

4.
